Exp.no : 09 **LOGISTIC REGRESSION**

AIM:

Experiment to understand Logistic Regression for a given data set.

PYTHON CODE:

```
import numpy as np
import pandas as pd
df=pd.read_csv('Social_Network_Ads.csv')
features=df.iloc[:,[2,3]].values
label=df.iloc[:,4].values
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LogisticRegression
for i in range(1, 401):
    x_train, x_test, y_train, y_test = train_test_split(
        features, label, test_size=0.2, random_state=i
    )
    model = LogisticRegression()
    model.fit(x_train, y_train)

    train_score = model.score(x_train, y_train)
    test_score = model.score(x_test, y_test)

    if test_score > train_score:
        print("Test {} Train{} Random State {}".format(
            test_score, train_score, i
        ))

x_train, x_test, y_train, y_test = train_test_split(
    features, label, test_size=0.2, random_state=2
)

finalModel = LogisticRegression()
finalModel.fit(x_train, y_train)

print(finalModel.score(x_train, y_train))
print(finalModel.score(x_test, y_test))

from sklearn.metrics import classification_report

print(classification_report(label, finalModel.predict(features)))
```

OUTPUT:

```
Test 0.6875 Train0.63125 Random State 3
Test 0.7375 Train0.61875 Random State 4
Test 0.6625 Train0.6375 Random State 5
Test 0.65 Train0.640625 Random State 6
Test 0.675 Train0.634375 Random State 7
